Turning minerals into fertiliser

Many farmers in Brazil buy potassium fertilisers, which are shipped in from far away.

A research group found a way to release potassium from potassium feldspar, a common rock found in Brazil.

Potassium feldspar is a cheaper source of potassium fertiliser because it is not transported so far. It is also a ‘greener’ source of potassium because less CO$_2$ is produced.

Have a think about:
1. Why do farmers need fertilisers in the first place?
2. Why is it cheaper if it is transported shorter distances?
3. Why is CO₂ ‘bad’?
