

## How to use this resource

At the start of the 21st century secondary education yet again underwent changes. These included the introduction of new curricula at all levels in England, Wales and Scotland and the Northern Ireland National Curriculum undergoing review. With more emphasis on cross curricula topics such as health, safety and risk, citizenship, education for sustainable development, key skills, literacy, numeracy and ICT, chemistry teachers must not only become more flexible and adaptable in their teaching approaches, but keep up to date with current scientific thinking. The major change to the science 11–16 curricula of England and Wales was the introduction of ‘ideas and evidence in science’, as part of Scientific Enquiry. This is similar to the ‘developing informed attitudes’ in the Scottish 5–14 Environmental studies, and is summarised in Figure 1.

In this series of resources, I have attempted to address the above challenges facing teachers, by providing:

- A wide range of teaching and learning activities, linking many of the cross-curricular themes to chemistry. Using a range of learning styles is an important teaching strategy because it ensures that no students are disadvantaged by always using approaches that do not suit them.
- Up-to-date background information for teachers on subjects such as global warming and Green Chemistry. In the world of climate change, air pollution and sustainable development resource material soon becomes dated as new data and scientific ideas emerge. To overcome this problem, the resources have been linked to relevant websites, making them only a click away from obtaining, for example, the latest UK ozone data or design of fuel cell.
- Resources to enable ideas and evidence in science to be taught within normal chemistry or science lessons. There is a need to combine experimental work with alternative strategies, if some of the concerns shown in Figure 1, such as social or political factors, are to be taught. This can be done for example, by looking at the way in which scientists past and present have carried out their work and how external factors such as a political climate, war and public opinion, have impinged on it.
- Activities that will enhance student’s investigative skills.

These activities are intended to make students think about how they carry out investigations and to encourage them to realise that science is not a black and white subject. The true nature of science is very creative, full of uncertainties and data interpretation can and does lead to controversy and sometimes public outcry. Some of the experiments and activities will be very familiar, but the context in which they are embedded provide opportunities for meeting other requirements of the curriculum. Other activities are original and will have to be tried out and carefully thought through before being used in the classroom. Student activities have been trialled in a wide range of schools and where appropriate, subsequently modified in response to the feedback received.

*Dorothy Warren*

Figure 1 The factors influencing the nature of scientific ideas– scientific enquiry and the advancement of science

### Maximising the potential use of this resource

It is hoped that this resource will be widely used in schools throughout the United Kingdom. However, as every teacher knows, difficulties can be experienced when using published material. No single worksheet can cater for the needs of every student in every class, let alone every student in every school. Therefore many teachers like to produce their own worksheets, tailored to meet the needs of their own students. It was not very surprising when feedback from trial schools requested differentiated worksheets to allow access to students of different abilities. In an attempt to address these issues and concerns, this publication allows the worksheet text and some diagrams to be modified. All the student worksheets can be downloaded in Word format, from the Internet via the LearnNet website, <http://www.chemsoc.org/networks/learnnet/ideas-evidence.htm> (accessed September 2005). This means that the teacher can take the basic concepts of the activity, and then adapt the worksheet to meet the needs of their own students. Towards the end of the teachers' notes for most activities there are some suggestions as to how the resource can be adapted to meet the needs of students of different abilities. There are also some examples of differentiated worksheets included in the resource.

It is not envisaged that teachers will use every activity from each piece of work with an individual class, but rather pick and choose what is appropriate. For example some activities use high level concepts and are designed to stretch the most able student and should not be used unchanged with less able students eg **The atom detectives** and **What happens when things burn?**

Activities that involve researching for secondary information on the Internet contain hyperlinks to appropriate websites. To minimise the mechanical typing of the URLs and possible subsequent errors, the students can be given the worksheet in electronic form and asked to type in their answers. The websites are then only a click away.

Appropriate secondary information has been included in the teachers' notes for use in class when the Internet or ICT room is unavailable.

Unfortunately, from time to time website addresses do change. At the time of publication all the addresses were correct and the date that the site was last accessed is given in brackets. To minimise the frustration experienced when this happens, it is advisable to check the links before the lesson. If you find that a site has moved, please email [education@rsc.org](mailto:education@rsc.org) giving full details so that the link can be updated on the worksheets on the web in the future.

## Strategies for differentiated teaching

All students require differentiated teaching and it is not just an issue for those students with special educational needs. The following definition by Lewis<sup>1</sup> has been found to be quite useful.

'Differentiation is the process of adjusting teaching to meet the needs of individual students.'

Differentiation is a complex issue and is very hard to get right. It can be involved in every stage of the lesson *ie* during planning (differentiation by task), at the end of the activity (differentiation by outcome) and ongoing during the activity. Often teachers modify the activity during the lesson in response to feedback from the class. Differentiation does not only rely on appropriate curriculum material but is also concerned with maximizing learning. Student involvement and motivation effect the learning experience and should be considered and taken into account. It is therefore not surprising that differentiation is one of the areas of classroom teaching where teachers often feel under-confident. Most strategies for differentiated lessons are just applying good teaching practice eg varying the pace of the lesson, providing suitable resources and varying the amount and nature of teacher intervention and time.<sup>2</sup> Rather than just providing several examples of differentiated activities from the same worksheet, a list of strategies for differentiated teaching is presented, with some examples of how they can be used in the classroom. The examples can be found at the appropriate places in the text.

### 1. Using a range of teaching styles

A class is made up of different personalities, who probably have preferred learning styles. Using a range of teaching approaches makes it more likely that all students will be able to respond to the science that is being taught. The following examples have been included and can be found at the appropriate place in the resource.

**Example** What happens when things burn?

Approach 1 – Working in groups and reporting back to the whole class

Approach 2 – A thinking skills lesson

**2. Varying the method of presentation or recording**

Giving the students some choice about how they do their work. There are many opportunities given throughout the resource.

**3. Taking the pupil's ideas into account**

Provide opportunities for students to contribute their own ideas to the lesson. For example when setting up an investigation allow different students the freedom to choose which variables they are going to investigate. The use of concept cartoons provides an ideal opportunity for students to discuss different scientific concepts (see D. Warren, *The nature of science*, London: Royal Society of Chemistry, 2001.)

**4. Preparing suitable questions in advance**

Class discussions are important in motivation, exploring ideas, assessment *etc.* Having a list of questions of different levels prepared in advance can help to push the class.

**5. Adjusting the level of scientific skills required**

**Example** – Using symbol equations or word equations

**6. Adjusting the level of linguistic skills required**

**Example** Norman Rillieux – Sparkling white crystals of sugar

Sheet 1 – a high reading age

Sheet 2 – a low reading age

Teachers may like to check the readability of their materials and of the texts they use. Guidance on this and on the readability of a range of current texts may be found at <http://www.timetabler.com/contents.html> (accessed September 2005).

**7. Adjusting the level of demand on the student**

**Example**

What happens when things burn? – both approaches are for the more able student.

Burning theories is much easier to understand and less demanding on students.

**How scientists communicate their ideas**

Effective communication is crucial to the advancement of science and technology. All around the globe there are groups of research scientists and engineers, in universities and in industry, working on similar scientific and technological projects. Communication between these groups not only gives the scientist new ideas for further investigations, but helps in the evaluation of data. Results from different groups will either help to confirm or reject a set of experimental data. Communication is vital when a company wants to sell a new product. Depending on the product the buyer will want to understand how it works and how to maintain it. Several of the employees will have to learn how to use the product, and respond quickly to changing technology and circumstances. Therefore the manufacturers must be able to communicate the science to prospective buyers.

Scientists communicate in a number of ways including:

- Publication in research journals
- Presenting papers at scientific conferences
- Poster presentations at conferences
- Book reviews by other scientists
- Publication on the Internet
- Sales brochures
- Advertising flyers
- Television documentaries

#### **Publication in research journals**

The article is written. The article must have an abstract, which is a short summary.

It is submitted to a journal.

The article is refereed by other scientists, working in a similar area. This is to check that the work is correct and original.

The article may be returned to the author to make changes.

The article is accepted and published by the journal.

The article is published.

#### **Presenting papers at scientific conferences**

Conference organisers invite scientists to speak on specific topics and projects.

An abstract is submitted to and accepted by the conference organisers.

The conference programme is organised and the speakers notified.

The scientist gives their talks, usually aided by slides, which contain the main points.

There is usually time for questions after the talk.

The written paper is given to the conference organisers.

All the papers are published in the conference proceedings. This is usually a book.

#### **Poster presentations at conferences**

An abstract is submitted to and accepted by the conference organisers.

The conference programme is organised and the poster people notified.

During the poster session the authors stand by the posters ready to answer any questions, as the delegates read the posters.

Written papers may then be published in the conference proceedings.

#### **Book reviews**

Other scientists in the same field often review new books. The reviews are then published in scientific magazines and journals. The review offers a critical summary of the book. The idea of the review is to give possible readers an idea of the contents and whether it is suitable for the intended purpose.

**Publishing on the Internet**

This is the easiest way to publish. Anyone can create their own web page and publish their own work. In this case the work is not refereed or checked by other people.

However, a lot of the information published on the Internet is linked to reputable organisations. In this case the articles will have been checked before they are published. Much of the information published on the Internet is targeted at the general public, and therefore the scientific ideas are presented in a comprehensible way. There are often chat pages so people can communicate their views and ask questions or request further information. The power of the Internet is that there is the opportunity to get immediate feedback to a comment or question.

**Sales brochures**

The information must be presented in an attractive and concise manner. After all you are trying to sell something. There should be a balance between technical information and operating instructions!

**Advertising flyers**

This must be written with the target audience in mind.

The information must be concise as there is limited space. The format must be attractive and should include pictures as well as writing. The flyer should also be quite cheap to produce.

**Teaching students to communicate ideas in science**

Students can be taught effective communication skills:

- By encouraging communication between students and a range of audiences in classrooms
- By encouraging them to investigate like 'real scientists' by reporting their findings for checking and testing by others, and participating in two-way communication. (Communicating between groups, classes, partner schools, schools abroad perhaps via the Internet.)
- By setting investigations in a social context which offers the opportunity to communicate the project outside of the classroom. These work best when there is local interest.

When presenting investigative work to an audience, the student should consider the following:

- Who will be in the audience?
- What information does the audience need to know *eg* method, results and recommendations?
- How to present the information in an interesting and professional way *eg* should graphs be hand drawn or done on the computer?
- That the information offered convinces the audience that their investigation was valid and reliable.
- Poster presentations or display boards should be concise, since the space is limited.
- When speaking to audiences remain calm, speak clearly and slowly and try to be enthusiastic. Make sure that information on slides and OHTs can be read from the back of the room.

When writing a report of the findings of a scientific investigation for others to check and test, the emphasis should be on clarity. Another person is going to carry out the same investigation. The only information available is what is written in the report.

The report could be written under the following headings:

- Introduction
- Scientific knowledge
- Planning
- Table of results
- Graphs
- Conclusions
- Evaluation
- Recommendations

### Further background information

R. Feasy, J. Siraj-Blatchford, *Key Skills: Communication in Science*, Durham: The University of Durham / Tyneside TEC Limited, 1998.

### Curriculum coverage

Curriculum links to activities in this resource are detailed at

<http://www.chemsoc.org/networks/learnnet/social-hist.htm> (accessed September 2005).

Curriculum links to activities in other resources in this series are detailed at

<http://www.chemsoc.org/networks/learnnet/ideas-evidence.htm> (accessed September 2005).

### Health and safety

All the activities in this book can be carried out safely in schools. The hazards have been identified and any risks from them reduced to insignificant levels by the adoption of suitable control measures. However, we also think it is worth explaining the strategies we have adopted to reduce the risks in this way.

Regulations made under the Health and Safety at Work *etc* Act 1974 require a risk assessment to be carried out before hazardous chemicals are used or made, or a hazardous procedure is carried out. Risk assessment is your employers responsibility. The task of assessing risk in particular situations may well be delegated by the employer to the head of science/chemistry, who will be expected to operate within the employer's guidelines. Following guidance from the Health and Safety Executive most education employers have adopted various nationally available texts as the basis for their model risk assessments. These commonly include the following:

*Safeguards in the School Laboratory*, 11th edition, ASE, 2001

*Topics in Safety*, 3rd Edition, ASE, 2001

*Hazcards*, CLEAPSS, 1998 (or 1995)

*Laboratory Handbook*, CLEAPSS, 1997

*Safety in Science Education*, DfEE, HMSO, 1996

*Hazardous Chemicals – a manual for science education*, SSERC, 1997 (paper).

*Hazardous Chemicals – an interactive manual for science education*, SSERC, 1998 (CD-ROM)

If your employer has adopted more than one of these publications, you should follow the guidance given there, subject only to a need to check and consider whether minor modification is needed to deal with the special situation in your class/school. We believe that all the activities in this book are compatible with the model risk assessments listed above. However, teacher must still verify that what is proposed does conform with any code of practice produced by their employer. You also need to consider your local circumstances. Is your fume cupboard reliable? Are your students reliable?

Risk assessment involves answering two questions:

- How likely is it that something will go wrong?
- How serious would it be if it did go wrong?

How likely it is that something will go wrong depends on who is doing it and what sort of training and experience they have had. In most of the publications listed above there are suggestions as to whether an activity should be a teacher demonstration only, or could be done by students of various ages. Your employer will probably expect you to follow this guidance.

Teachers tend to think of eye protection as the main control measure to prevent injury. In fact, personal protective equipment, such as goggles or safety spectacles, is meant to protect from the unexpected. If you expect a problem, more stringent controls are needed. A range of control measures may be adopted, the following being the most common. Use:

- a less hazardous (substitute) chemical;
- as small a quantity as possible;
- as low a concentration as possible;
- a fume cupboard; and
- safety screens (more than one is usually needed, to protect both teacher and students).

The importance of lower concentrations is not always appreciated, but the following table, showing the hazard classification of a range of common solutions, should make the point.

Ammonia (aqueous)	irritant if $\geq 3 \text{ mol dm}^{-3}$	corrosive if $\geq 6 \text{ mol dm}^{-3}$
Sodium hydroxide	irritant if $\geq 0.05 \text{ mol dm}^{-3}$	corrosive if $\geq 0.5 \text{ mol dm}^{-3}$
Ethanoic (acetic) acid	irritant if $\geq 1.5 \text{ mol dm}^{-3}$	corrosive if $\geq 4 \text{ mol dm}^{-3}$

Throughout this resource, we make frequent reference to the need to wear eye protection. Undoubtedly, chemical splash goggles, to the European Standard EN 166 3 give the best protection but students are often reluctant to wear goggles. Safety spectacles give less protection, but may be adequate if nothing which is classed as corrosive or toxic is in use. Reference to the above table will show, therefore, that if sodium hydroxide is in use, it should be more dilute than 0.5 M ( $M = \text{mol dm}^{-3}$ ).

### CLEAPSS Student Safety Sheets

In several of the student activities CLEAPSS student safety sheets are referred to and recommended for use in the activities. In other activities extracts from the CLEAPSS sheets have been reproduced with kind permission of Dr Peter Borrow, Director of the CLEAPSS School Science Service at Brunel University.

- Teachers should note the following points about the CLEAPSS Student Safety Sheets:
  - Only extracts from fuller student safety sheets have been reproduced.
  - Only a few examples from a much longer series of sheets have been reproduced.
  - The full series is only available to member or associate members of the CLEAPSS School Science Service.
  - At the time of writing, every LEA in England, Wales and Northern Ireland (except Middlesbrough) is a member, hence all their schools are members, as are the vast majority of independent schools, incorporated colleges and teacher training establishments and overseas establishments.
  - Members should already have copies of the sheets in their schools.
  - Members who cannot find their sheets and non-members interested in joining should contact the CLEAPSS School Science Service at Brunel University, Uxbridge, UB8 3PH; tel. 01895 251496; fax. 01895 814372; email [science@cleapss.org.uk](mailto:science@cleapss.org.uk) or visit the website <http://www.cleapss.org.uk> (accessed September 2005).
  - In Scotland all education authorities, many independent schools, colleges and universities are members of the Scottish Schools Equipment Resource Centre (SSERC). Contact SSERC at St Mary's Building, 23 Holyrood Road, Edinburgh, EH8 8AE; tel. 0131 558 8180, fax 0131 558 8191, email [sts@sserc.org.uk](mailto:sts@sserc.org.uk) or visit the website <http://www.sserc.org.uk> (accessed September 2005).

# Using the resource on an Intranet

If your school or college has an Intranet you may wish to download the material in part or in whole to the Intranet to facilitate easy links for students. Alternatively you could use some of the web references given to design an interactive worksheet. Instructions for this are given below.

## Designing an interactive worksheet

These instructions are for Microsoft Word.

- First you need to do some research on the Internet to find the relevant sites related to the topic and note down the website addresses, or use the sites already known and available from the resource.
- Choose an appropriate font, size and colour for your text.
- Type in the title of the page.
- Save this page as an HTML file in order to make the page 'live'.
- Type in the instructions and questions that you want the students to read.
- Type in the web page address (url). Always begin `http://www` (this will automatically make the page a hyperlink to the website you have typed and the text will turn blue).

Now you can make your work look more like a web page by placing lines, graphics, scrolling text and backgrounds in it.

- To place a horizontal line on your page, put the cursor where you would like the line to be, then click on insert, go to horizontal line, choose a line and click on OK.
- To add a background to your page, click on format, go to background, then fill effects option, choose an effect and click on OK.
- To add a picture to your work, place the cursor where you would like the picture to be, then click on insert, go to picture and clip art option. Choose a suitable picture for your work and click on OK. The picture size can be altered by moving the edges in or out or the picture can be moved to another place by dragging it over.
- To place scrolling text in your work, you need to highlight the words, click on insert, go to scrolling text, choose background colour, the speed of the scroll and press OK. (If you are going to print this work out, the scrolling text will not print out).

Your work is now beginning to look like an interactive web page.

- When you are satisfied with the final product, click on file, go to web page preview and this will show you what your page looks like. (You cannot alter your page through the web page preview screen; you will have to go back to Word).
- Remember to do a spell check on your work, *ie* click on the ABC icon on the top of toolbar.
- Test out your page.

Now you are ready to use the page with students.
