

'Life would be unrecognisable without plastic'

Education in Chemistry May 2021 https://rsc.li/32kIM78

Can you imagine a world without plastic? How many times have you encountered plastic today?

If you had a shower, was the shampoo in a plastic bottle? Do your clothes contain plastic fibres? Did your breakfast come packaged in plastic to keep it fresh? Did you brush your teeth with a plastic toothbrush?

In the article, *Plastic fantastic,* the author has written: 'We all have homes filled with plastic ... Life would be unrecognisable without it.' Do you agree with this statement?

Activity 1

Use the template below to make a list of some of the interactions you have with plastic every day. If you know of a readily available alternative, add it to the last column. Aim to add 10–15 items to the template. Ask your teacher or peers for more ideas if you get stuck.

| Plastic item | Potential alternative |
|-----------------|-----------------------|
| Polyester shirt | Cotton shirt |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

Activity 2

Choose three items from your table that are easy to change and three which are not. Write a sentence about each to describe why you have chosen it and why it is difficult or easy to substitute.

| | Easy substitutes | Difficult substitutes |
|---------|--|--|
| Example | Plastic item: Teabag | Plastic item: Crisp packet |
| l | Replaced with: Tea strainer | Replaced with: Paper bag |
| | Explanation: Single-use teabags which don't break down in compost or landfill are wasteful. Tea strainers are reusable, and the leaves can be added to gardens or home composting. Loose tea leaves are available in most supermarkets which makes it an easy swap. | Explanation: Alternatives to plastic packaging for snacks like crisps are not readily available. Other materials such as paper are not as effective at keeping food fresh. Plastic packaging helps to reduce food waste and is more hygienic. |
| 1. | Plastic item: | Plastic item: |
| | Replaced with: | Replaced with: |
| | Explanation: | Explanation: |
| | | |
| 2. | Plastic item: | Plastic item: |
| | Replaced with: | Replaced with: |
| | Explanation: | Explanation: |
| 3. | Plastic item: | Plastic item: |
| | Replaced with: | Replaced with: |
| | Explanation: | Explanation: |

Evaluation: Is our life filled with plastic and unrecognisable without it?

Use the evidence you have gathered during the first two activities to evaluate the statement: 'We all have homes filled with plastic ... Life would be unrecognisable without it.' Draw on evidence that supports and opposes the statement. Your evaluation should include:

- evidence for the prevalence (or not) of plastic in everyday life.
- properties of plastic that make it a material of choice for so many different applications.
- an example of an item that could easily be swapped for an alternative.
- an example of an item that there is no suitable or easy alternative for.
- your opinion on the original statement.

Extension:

- Is it necessary to reduce the use of plastic in everyday life? Why, or why not?
- Discuss whose responsibility it should be to reduce plastic use. Should it be the consumer, the manufacturer or the government? What can you do?

Chemistry careers

Visit the <u>A Future in Chemistry</u> website to find out more about how chemistry is tackling the plastic problem. Start by checking out these job profiles:

- Analytical technician Celine develops ways to alter the structure of plastics so they become biodegradable in the natural environment: <u>https://edu.rsc.org/job-profiles/analytical-technician-plastics/4010921.article</u>
- Research innovations manager What Margot loves about her job is that she gets to apply chemistry to real-life problems, in this case fighting the war on plastics: <u>https://edu.rsc.org/job-profiles/research-innovations-</u> manager/4010862.article
- Marine biogeochemist
 Ben's research focuses on how the biology and chemistry of our oceans are responding to climate
 change in order to learn how we can protect our marine environments and ecosystems:
